

What You Need to Know About

Respiratory Syncytial Virus (RSV) Vaccine

RSV is a highly contagious virus that may cause respiratory disease which can make it difficult to breathe, and possibly require hospitalization

Key Points

This is a new vaccine indicated for people 60 years of age and older for the prevention of lower respiratory tract disease caused by RSV.

If you have asthma, congestive heart failure (CHF), or chronic obstructive pulmonary disease (COPD), you may be at increased risk of severe RSV infection.

If you have coronary artery disease (CAD) or diabetes, there is evidence to suggest you may be at increased risk of hospitalization due to RSV.

Patient Information

1 RSV is most associated with infants & children; however elderly adults can have severe cases.

2 Symptoms of RSV can range from mild to severe and can last up to 2 weeks.

3 Most insurance companies cover the vaccine at no cost to you!
